1. Brandon - Tempest

The game was interesting and well presented. I was amazed at how the game looks and knowing the math behind each level is fascinating. I liked the clear explanation of the relationship between the classes. I also understood why bulletpool was a good choice because it creates a fixed amount of bullets, 64, which can help manage objects during gameplay. I noticed the implementation of a singleton pattern for the scoremanager which made sense because the game only needs one scoring system that can be accessed throughout. One suggestion I have is to add different kinds of enemy to shoot or different shooting patterns, like zigzag shots. Another suggestion would be to consider how the Open/Closed Principle could be applied so that new enemy or shooting behaviors could be added without modifying existing code. Overall, the game is good, and something that I would enjoy playing.

2. Nico - Starfall Armada

I super liked the storyline and thought it gave the game clear purpose beyond being a Galaga inspired game. The presentation of the design pattern was also well explained. I also thought the game has several creative features, especially the intro, karma choice, and the boat fight. The audio introduction was another detail that I liked because it helped set a goal for the player. One suggestion I would have is to consider using actual character designs as well as enemies and power-ups while in game aside from bullets which inheritance and composition can be implemented. Overall, I thought Startfall Armada was a creative and well presented game concept.

3. Mensong - Ocean Fishing

The concept is very unique and I like how you have different ocean-level settings. I also like how there are six states that control every fishing encounter which gives the player a different experience while fishing. I noticed the use of different design patterns such as the Observer pattern with the PointManager, the factory pattern to generate the fish and the Singleton with the ResourceManager. The graphics are also nice and the smooth sailing from

shore to the certain ocean level. One thing I would like to see is a graphic or animation of the fish being caught, since it could make the fishing experience more interactive. I was also confused about the use of inheritance for the fish. Maybe incorporating more of the inheritance would make the relationship between different types of fish more clear and show how they share common behavior but do unique things too. Overall, I think the game has a unique concept and is pretty cool to play.

4. Tyler - Simple jumping platformer

I like how the game is inspired by Geometry Dash, especially the progress bar at the top that shows how close the player is to the finish line. The basic game loop is already there, but I think adding more features could make the game more interesting and challenging. For example, adding different types of obstacles could require the player to act and time their jumps more carefully. Power-ups could also be added to give players temporary abilities. These would be a good way to use classes, inheritance and composition. In addition, during your demo, I noticed the uneven platform where the player is supposed to jump up and the possibility of getting stuck and ending the game but the player seems that it can just pass through it. Maybe that needs to be fixed. Also, maybe add another level to the game just to show the comparison between levels. Overall, it's a good game and a good start and it can be developed into an enjoyable game.
